

Horseshoe Lake Survey Summary

Horseshoe Lake, located 9.0 miles south and 4.5 miles west of Webster, is managed as a smallmouth bass, walleye and yellow perch fishery; other fish species (e.g., northern pike) are present and contribute to the fishery.

- **Smallmouth bass.** More smallmouth bass were sampled in 2019 (38.0/hour) than 2018 (19.0/hour). In 2019, sampled fish ranged in length from 13.0 to 19.3 inches, most (97%) were ≥ 14.0 inches and 74% were 17.0 inches or longer. Though smallmouth bass are not abundant, those present tend to be larger and of interest to a segment of anglers.
- **Walleye.** A 28-inch minimum length limit and one fish daily limit is in effect for walleyes at Horseshoe Lake. The objective of the regulation is to provide a unique fishery with high catch rates for large fish. In 2019, the relative abundance of walleyes in the gill net catch was low to moderate (4.1/gill net). Sampled walleyes ranged in length from 6.3 to 27.6 inches of the fish that were at least 10.0 inches more than half (51%) were 20.0 inches or longer. Individuals from eight year classes contributed to the catch, those from the 2017 (age-2) cohort were the most abundant accounting for 40% of walleyes in the sample. Growth appears to be variable with mean length at capture values from 13.9 to 18.0 inches for age-3 walleyes sampled since 2011.
- **Yellow perch.** Yellow perch were not abundant (4.7/gill net) in 2019. Those sampled ranged in length from 5.1 to 10.2 inches, nearly 70% were from the 2018 (age-1) cohort, which had a mean length at capture of 5.8 inches.
