Waubay Lake Survey Summary

Waubay Lake, located on the southeastern edge of Grenville, is managed as a walleye and yellow perch fishery but other fish species (e.g., smallmouth bass, white bass) also contribute to the fishery.

- **Walleye.** Walleyes in the 2020 gill net catch ranged in length from 7.5 to 22.8 inches, more than one-third (39%) were <10.0 inches owing to the presence of the strong 2019 (age-1) cohort, which coincided with a fry stocking. Relative abundance of walleyes ≥10.0 inches was moderate to high at 8.1/gill net, 80% were ≥15.0 inches and 7% were ≥20.0 inches. Year classes produced in 2011 and 2016, both of which coincided with fry stockings, were also abundant accounting for an additional 36% of fish in the sample. The 2016 cohort has experienced fast growth to age 4 with a mean length at capture of 16.8 inches.

- **White bass.** White bass were not abundant (2.4/gill net). The 2020 gill net catch included 36 white bass from 11.8 to 17.3 inches.

- **Yellow perch**. At 9.5/gill net, relative abundance was considered low to moderate in 2020. Sampled yellow perch ranged in length from 5.1 to 11.0 inches, 61% were ≥8.0 inches and 1% were ≥10.0 inches. Individuals from three year classes (2016, 2018, and 2019) contributed to the catch, those from the 2018 (age-2) cohort were the most abundant accounting for 73% of fish in the sample. Yellow perch growth is moderate to fast with mean length at capture's at age 2 from 7.3 to 8.5 inches in surveys conducted since 2011. In 2020, the mean length at capture of age-2 fish was 8.3 inches.

For more detailed results see the computer generated South Dakota Statewide Fisheries Survey for Waubay (Day; below).

SOUTH DAKOTA STATEWIDE FISHERIES SURVEY
Waubay, Day County
UBS-Lake-411-000
2020

Lake Information

Name: Waubay

County: Day

Surface Area: 16,943 Acres

Maximum Depth: 31 Feet

Mean Depth: 13 Feet

OHWM Elevation: 1,787

Surveys and Investigations

Survey methods used by gear type, date, and effort.

Gear	Date	Effort
AFS std gill net	Aug 18, 2020	6 net-nights
AFS std gill net	Aug 19, 2020	6 net-nights
AFS std gill net	Aug 20, 2020	3 net-nights
fall night EF-WAE	Sep 17, 2020	3600 seconds

Common Fish Species Present

Northern Pike

Walleye

Smallmouth Bass

Yellow Perch

Black Bullhead

White Bass

Common Carp

Rock Bass

Black Crappie

Lake Herring

Terminology

Catch per unit effort (**CPUE**) refers to the relative abundance of a species. It is defined as the number of fish captured per unit of effort (i.e., number of fish captured per net-night or number of fish captured per hour electrofishing). In this report CPUE is typically given for only stock-length fish (see length categories table for stock lengths).

A statewide effort to help make netting efforts comparable to all waters sampled across the state, occurred in 2017, with a switch to American Fisheries Society gill nets. Past gill netting efforts were completed with different style/types of nets and are not comparable side by side.

- **AFS std gill net** – 80 ft experimental gill net containing eight panels (10 ft each) of varying monofilament meshes of 0.75, 1.00, 1.25, 1.50, 1.75, 2.00, 2.25 and 2.50 inches.
- **std experimental gill net for non-Missouri River waters** - 150 ft experimental gill net containing six panels (25 ft each) of varying monofilament meshes of 0.5, 0.75, 1.00, 1.25, 1.50 and 2.00 inches.
- s**td experimental gill net for Missouri River reservoirs** – 300 ft experimental gill net containing six panels (50 ft each) of varying multifilament meshes of 0.5, 0.75, 1.00, 1.25, 1.50 and 2.00 inches.

$$CPUE = \frac{number\ of\ fish}{effort}$$

Population size structure is quantified using the indices proportional size distribution of quality-length fish (**PSD**) and proportional size distribution of preferred-length fish (**PSD-P**). These indices indicate the proportion of stock-length fish that are equal to or greater than a given length. Minimum lengths for stock, quality and preferred length fish are given in the length categories table.

$$PSD = \left(\frac{number\ of\ fish \geq quality\ length}{number\ of\ fish \geq stock\ length}\right) \text{x } 100$$

$$PSD - P = \left(\frac{number\ of\ fish \geq preferred\ length}{number\ of\ fish \geq stock\ length}\right) \text{x } 100$$

Relative weight (**Wr**) is used to quantify fish plumpness. Relative weight is the ratio of what a fish weighs (W) compared to a length-specific standard weight (Ws) multiplied by 100. Relative weight values of 95-105 are commonly cited as optimum values, but values in the 80s are common during summer sampling in South Dakota.

$$Wr = \left(\frac{W}{Ws}\right) \text{x } 100$$

Confidence intervals (**CI**) are provided for many of the estimates calculated in this report. The confidence interval provides a range in which the true mean is expected to fall. For example, with an 80% CI we are 80% confident that the interval contains the true value.

Length categories include stock (**S**), quality (**Q**), preferred (**P**), memorable (**M**) and trophy (**T**). Length categories for most species have been defined based on a percentage of the world record length for that species. Some species mentioned in this report do not have defined length categories. Length categories for species used in this report are provided in the following table. Measurements are the minimum total length for each category and are reported in inches (in) and centimeters (cm).

	Stock		Quality		Preferred		Memorable		Trophy	
Species Name	(in)	(cm)	(in)	(cm)	(in)	(cm)	(in)	(cm)	(in)	(cm)
